1 Preliminary Hydrocarbon Forensic Review of Peter Cooper Village and Stuyvesant Town 2017 Indoor Air Monitoring Results

1.1 Introduction

In October 2017, indoor air sampling was conducted at the Former East 21st Street Works former manufactured gas plant (MGP) Site and Former East 14th, 17th, and 19th Street Holder Stations located in Manhattan, New York (hereinafter referred to as the Site). The investigation activities were conducted in general accordance with the *Interim Site Management Plan Work Plan Indoor Air Sampling Former East 21st Street Works* (AECOM 2009a) and the *Interim Site Management Plan Work Plan Indoor Air Sampling Former East 21st Street Works Former East 14th Street Station, Former 17th Street Station, Former 19th Street Station* (AECOM 2009b).

As part of this sampling program, ambient (outside) and indoor air volatile organic carbon (VOC) compound results from the residential apartment buildings located at Peter Cooper Village (PCV) and Stuyvesant Town (ST) were subjected to chemical environmental forensic evaluation. Chemical environmental forensic evaluation is the evaluation of patterns in chemical data to draw conclusions about contaminant sources at a site. The objective of this forensic evaluation was to determine if the presence of chemical constituents detected in indoor air samples, at concentrations above guidance values, could be attributed to MGP-related contamination (including coal tar) in subsurface soil and groundwater.

As detailed below, the results of the forensic evaluation concluded that the chemical constituents detected in the indoor air samples were attributed to the use and storage of chemical products at PCV and ST, including paints, paint thinners and cleaning agents, and not MGP-related contamination.

1.2 Methods

Anchor QEA, LLC, reviewed the laboratory results for all samples collected at PCV, which were analyzed by U.S. Environmental Protection Agency (EPA) Compendium Method TO-15, titled, "*Determination of VOCs In Air Collected in Specially-Prepared Canisters and Analyzed by Gas Chromatography/Mass Spectrometry (GC/MS)*" (EPA 1999). In addition to the TO-15 Target Analyte List, the samples were analyzed for n-alkanes, isopropyl benzene, and naphthalene.

Other than noting individual exceedances, Anchor QEA excluded the following two sets of chemical results from forensic analysis:

- Halogenated compounds (compounds containing chlorine or bromine) were excluded because they are not associated with residual materials generated from historical MGP operations (such as MGP tar).
- The tentatively identified compounds (TICs) butane and pentane were excluded. This is because the concentration of a TIC can't be confirmed until the compound can be detected by analyzing it with a known standard.
- The remaining hydrocarbon compounds, which were subject to forensic analysis, are listed in Table 1.

1.3 Rationale

Table 1 compounds are either aromatic (benzene, toluene, ethylbenzene and xylenes (BTEX) and related compounds; blue shading in Table 1) or aliphatic (saturated straight chain and branched chains; orange shading in Table 1). The VOC compounds in Table 1 are present in MGP residuals, crude petroleum, and petroleum distillates such as diesel and gasoline. The VOCs in Table 1 found in residential and commercial building indoor air can also arise from the myriad of petroleum-based products used and stored by homeowners and industry. Therefore, these VOCs are not MGP-specific but may result from multiple hydrocarbon sources (Uhler 2010; Murphy and Morrison 2015; Azzolina et al. 2014).

MGP residuals (including coal tar) are dominated by aromatic compounds. In contrast, petroleum and petroleum distillates are dominated by aliphatic compounds (EPRI 2000; Murphy and Morrison 2015). Consequently, vapor VOCs from an MGP-related source (such as coal tar) will contain proportionally more aromatic compounds, and vapor from a petroleum source will contain proportionally more aliphatic compounds (Uhler 2010; Azzolina et al. 2014), and the ratio of aliphatic/aromatic compounds may therefore be used to discriminate between MGP tar and petroleum distillates in vapor.

1.4 Results

The following types of results were evaluated:

- Chemical concentrations
- Diagnostic chemical ratios of aliphatic versus aromatic compounds designed to distinguish MGP tar from petroleum-related sources
- Hydrocarbon fingerprint profile plots

The fingerprint profile plots arrange the chemicals in Table 1 along the x-axis and the bar heights correspond to chemical concentrations denoted on the y-axis. The shape of the fingerprint profile plot is a visual representation of the hydrocarbon composition and provides insight into possible

sources contributing to the sample chemical composition. To aid fingerprint evaluation, fingerprint profile plots have color-coded aliphatic and aromatic compounds, and compounds are arranged in increasing molecular weight order (Table 1).

Samples were divided into three groups based on collection location and results (Table 2):

1. Outdoor ambient air samples
2. High-concentration indoor air samples
3. Low-concentration indoor air samples

Two indoor samples, categorized as high-concentration samples, were distinct from their associated outdoor ambient samples. The remaining indoor samples are categorized as low-concentration with respect to concentration of VOC compounds.

The "high concentration indoor air samples" (IA-3-02-20171014 and IA-441-01PR-2017101), contained concentrations of aliphatic, aromatic, and total hydrocarbons at approximately one order of magnitude greater than the maximum concentration observed in the "outdoor ambient air samples" and the other "low-concentration indoor air samples" (Table 2). Based on these results, the high-concentration indoor air samples were further evaluated to determine if a specific source was contributing to the elevated concentrations at their locations.

The location notes for the high-concentration indoor samples stated these samples were collected in an area where paint and paint-related products were being stored and used.

The hydrocarbon fingerprint profile plots for the high-concentration indoor samples were dominated by toluene—note the bar height for toluene in Figure 1 versus the bar height for the other chemicals. Toluene is an ingredient found in some paints, paint removers and or thinners. Additionally, sample IA-3-02-20171014 had relatively high concentrations of aliphatic compounds typically found in mineral-oil-based paint thinners.

Based on the forensic analysis, the presence of high-concentrations of VOCs at these locations likely resulted from paint storage and painting operations, both of which were documented during the indoor air survey. Dominance of toluene and aliphatic compounds is inconsistent with MGP tar composition (EPRI 2000; Uhler 2010; Murphy and Morrison 2015; Azzolina et al. 2014).

Excepting the two high-concentration indoor samples noted above, there was only one indoor air sample with a hydrocarbon exceedance of New York State Department of Health Fuel Oil Indoor Air Upper Fence or EPA BASE 90th Percentile screening levels. Sample IA-5-01-20171014 had a naphthalene concentration of 5.6 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$), which slightly exceeded the EPA BASE 90th Percentile screening level of $5.1 \mu\text{g}/\text{m}^3$.

Attachment 1 provides the hydrocarbon fingerprint profile plots for all outdoor and indoor samples. Hydrocarbon fingerprints profiles for low-concentration indoor air samples were very variable, not indicating any consistent hydrocarbon vapor source at the Site. Most fingerprint profiles contained a generally equally weighted mixture of aromatic and aliphatic compounds (Figure 2), which is inconsistent with MGP tar composition. A few low-concentration samples were dominated by toluene, possibly indicating local inputs from painting operations.

Diagnostic aliphatic versus aromatic ratio results are presented in Table 3, with comparisons to typical MGP tar and petroleum product results from Uhler et al. (2010). Table 3 demonstrates that the ratios for MGP tar are well outside the range of ratio results for the ambient and indoor air samples at PCV and ST. The indoor air results from PCV and ST are inconsistent with MGP tar as the source of the air vapor hydrocarbons. Two of the ratios are plotted in a double-ratio plot (Figure 3). Figure 3 illustrates indoor air samples have a broader range of compound ratios than ambient air samples, which is consistent with localized indoor source(s) for hydrocarbon VOCs; however, the indoor air samples differentiate more from the MGP tar than the ambient outdoor samples, strongly indicating the indoor air hydrocarbon sources are unrelated to MGP tar.

n-Undecane	C11	Aliphatic	156.31
n-Dodecane	C12	Aliphatic	170.34

Notes:

Orange shading indicates aliphatic compounds.

Blue shading indicates aromatic compounds.

Table 2
Hydrocarbon Concentration Summary

Chemical Group	Ambient Outdoor Air Samples (N = 6)			High Concentration Indoor Air Samples		Low Concentration Indoor Air Samples (N = 73)		
	Minimum	Maximum	Mean	IA-3-02-20171014	IA-441-01PR-20171013	Minimum	Maximum	Mean
Aliphatic Hydrocarbons ($\mu\text{g}/\text{m}^3$)	0.72	8.9	4.5	518	483	2.3	41	9.2
Aromatic Hydrocarbons ($\mu\text{g}/\text{m}^3$)	0.85	9.3	3.8	207	1345	2.8	50	10.2
Total Hydrocarbons ($\mu\text{g}/\text{m}^3$)	1.6	18.2	8.3	725	1828	5.1	91	19

Notes:

$\mu\text{g}/\text{m}^3$: micorgrams per cubic meter

Table 3**Diganostic Ratios of Aliphatic versus Aromatic Compounds**

Ratio	Ratio Type	Crude Petroleum and Petroleum Products*		Ambient Outdoor Air Samples	Indoor Air Samples
C6/B	Aliphatic/Aromatic	1.6 - 5.5	0.02	0.61 - 3.8	0.62 - 16.0
BTEX/C6-C9	Aromatic/Aliphatic	0.34 - 1.8	102	3.6 - 11.3	1.4 - 60.5
124M/C9	Aromatic/Aliphatic	0.16 - 12.4	63	0.85 - 1.1	0.18 - 4.9

*Ratios are calculated using data from Uhler et al. 2010; petroleum products are North Slope Crude Oil, aviation gasoline, jet fuel A, light naphtha, gasoline, and diesel; MGP tar is unweathered coal tar.

BTEX = sum of benzene (B), toluene, ethylbenzene and xylenes; C6-C9 = Sum of n-hexane (C6), n-heptane (C7), n-octane (C8) and n-nonane (C9), 124M = 1,2,4, trimethylbenzene.

MGP: manufactured gas plant

Notes:

Detected concentration is greater than NYSDOH Fuel Oil Indoor Air Upper Fence Screening Level (Table C1, NYSDOH 2006)

Detected concentration is greater than EPA BASE 90th Percentile Screening Level (Table C2, NYSDOH 2006)

Reference: NYSDOH (New York State Department of Health), 2006. *Guidance for Evaluating Soil Vapor Intrusion in the State of New York*. Final. October 2006.

Indoor air samples collected by Anchor QEA between 10/12/2017 and 10/17/2017

Data underwent Stage 2A Data Validation

bold = detected result

J = estimated value

NJ = tentatively identified compound (estimated)

U = compound analyzed, but not detected above detection limit

UJ = compound analyzed, but not detected above estimated detection limit

UN = tentatively identified compound not found

$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

AB = ambient air

CAS RN = Chemical Abstracts Service Registry Number

EPA = U.S. Environmental Protection Agency

FD = field duplicate

N = normal sample

NYSDOH = New York State Department of Health

Notes:

Detected concentration is greater than NYSDOH Fuel Oil Indoor Air Upper Fence Screening Level (Table C1, NYSDOH 2006)

Detected concentration is greater than EPA BASE 90th Percentile Screening Level (Table C2, NYSDOH 2006)

Reference: NYSDOH (New York State Department of Health), 2006. *Guidance for Evaluating Soil Vapor Intrusion*

Indoor air samples collected by Anchor QEA between 10/12/2017 and 10/17/2017

Data underwent Stage 2A Data Validation

bold = detected result

J = estimated value

NJ = tentatively identified compound (estimated)

U = compound analyzed, but not detected above detection limit

UJ = compound analyzed, but not detected above estimated detection limit

UN = tentatively identified compound not found

$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

AB = ambient air

CAS RN = Chemical Abstracts Service Registry Number

EPA = U.S. Environmental Protection Agency

FD = field duplicate

N = normal sample

NYSDOH = New York State Department of Health

Notes:

Detected concentration is greater than NYSDOH Fuel Oil Indoor Air Upper Fence Screening Level (Table C1, NYSDOH 2006)

Detected concentration is greater than EPA BASE 90th Percentile Screening Level (Table C2, NYSDOH 2006)

Reference: NYSDOH (New York State Department of Health), 2006. *Guidance for Evaluating Soil Vapor Intrusion*

Indoor air samples collected by Anchor QEA between 10/12/2017 and 10/17/2017

Data underwent Stage 2A Data Validation

bold = detected result

J = estimated value

NJ = tentatively identified compound (estimated)

U = compound analyzed, but not detected above detection limit

UJ = compound analyzed, but not detected above estimated detection limit

UN = tentatively identified compound not found

$\mu\text{g}/\text{m}^3$ = micrograms per cubic meter

AB = ambient air

CAS RN = Chemical Abstracts Service Registry Number

EPA = U.S. Environmental Protection Agency

FD = field duplicate

N = normal sample

NYSDOH = New York State Department of Health
